Abstract

This document provides a non-proprietary FIPS 140-2 Security Policy for the Java Cryptographic Module Version 1.1.

1 Introduction

1.1 About FIPS 140

Federal Information Processing Standards Publication 140-2 — Security Requirements for Cryptographic Modules specifies requirements for cryptographic modules to be deployed in a Sensitive but Unclassified environment. The National Institute of Standards and Technology (NIST) and Communications Security Establishment of Canada (CSEC) Cryptographic Module Validation Program (CMVP) runs the FIPS 140 program. The CMVP accredits independent testing labs to perform FIPS 140 testing; the CMVP also validates test reports for modules meeting FIPS 140 validation. *Validated* is the term given to a product that is documented and tested against the FIPS 140 criteria.

More information is available on the CMVP website at <http://csrc.nist.gov/groups/STM/cmvp/index.html>.

1.2 About this Document

This non-proprietary Cryptographic Module Security Policy for the Java Cryptographic Module Version 1.1 from Symantec provides an overview of the product and a high-level description of how it meets the security requirements of FIPS 140-2. This document contains details on the module's cryptographic keys and critical security parameters. This Security Policy concludes with instructions and guidance on running the module in a FIPS 140-2 mode of operation.

The Symantec Java Cryptographic Module Version 1.1 may also be referred to as the “module” in this document.

1.3 External Resources

The Symantec website (<http://www.symantec.com>) contains information on Symantec products. The Cryptographic Module Validation Program website (<http://csrc.nist.gov/groups/STM/cmvp/documents/140-1/1401val2012.htm>) contains links to the FIPS 140-2 certificate and Symantec contact information.

1.4 Notices

This document may be freely reproduced and distributed in its entirety without modification.

1.5 Acronyms

The following table defines acronyms found in this document:

Acronym	Term
AES	Advanced Encryption Standard
AIX	Advanced Interactive eXecutive
ANSI	American National Standards Institute
API	Application Programming Interface
CBC	Cipher Block Chaining
CCM	Counter with CBC-MAC
CFB	Cipher Feedback
CMVP	Cryptographic Module Validation Program
CO	Crypto Officer
CSEC	Communications Security Establishment Canada
CSP	Critical Security Parameter
CTR	Counter
DES	Data Encryption Standard
DESX	Data Encryption Standard XORed
DH	Diffie-Hellman
DMZ	Demilitarized Zone
DRBG	Deterministic Random Bit Generator
DSA	Digital Signature Algorithm
EC	Elliptic Curve
ECB	Electronic Code Book
ECC	Elliptic Curve Cryptography
ECDH	Elliptic Curve Diffie-Hellman
ECDRBG	Elliptic Curve Deterministic Random Bit Generator
ECDSA	Elliptic Curve Digital Signature Algorithm
ECIES	Elliptic Curve Integrated Encryption System
EMC	Electromagnetic Compatibility
EMI	Electromagnetic Interference
FCC	Federal Communications Commission
FIPS	Federal Information Processing Standard
FTP	File Transfer Protocol
GCM	Galois/Counter Mode
GPC	General Purpose Computer
GUI	Graphical User Interface
HMAC	(Keyed-) Hash Message Authentication Code
HP	Hewlett-Packard
HTTP	Hypertext Transfer Protocol
HTTPS	Secure Hypertext Transfer Protocol

IBM	International Business Machine
JAR	Java Archive
JRE	Java Runtime Environment
JVM	Java Virtual Machine
KAT	Known Answer Test
LAN	Local Area Network
MAC	Message Authentication Code
MD	Message Digest
MTA	Mail Transfer Agent
NIS	Network Information Service
NIST	National Institute of Standards and Technology
OEAP	Optimal Asymmetric Encryption Padding
OFB	Output Feedback
OS	Operating System
PBE	Password Based Encryption
PKCS	Public-Key Cryptography Standards
PRNG	Pseudo Random Number Generator
PSS	Probabilistic Signature Scheme
RC	Rivest Cipher
RACE	Research and Development in Advanced Communications Technologies in Europe
RIPEMD	RACE Integrity Primitives Evaluation Message Digest
RNG	Random Number Generator
RSA	Rivest, Shamir, and Adleman
SEP	Symantec Endpoint Protection
SHA	Secure Hash Algorithm
SMTP	Simple Mail Transfer Protocol
SP	Special Publication
SSL	Secure Sockets Layer
TDEA	Triple Data Encryption Algorithm
TDES	Triple Data Encryption Algorithm
TLS	Transport Layer Security
USB	Universal Serial Bus

Table 1 – Acronyms and Terms

2 Symantec Java Cryptographic Module Version 1.1

2.1 Cryptographic Module Specification

The module is the Symantec Java Cryptographic Module Version 1.1, which is a software shared library that provides cryptographic services required by Symantec’s line of software products. The module is a software-only module installed on a General Purpose Computer running Windows XP SP2.

The module is comprised of two components:

1. The Symantec cryptographic module wrapper fully initializes and manages FIPS mode. This includes performing an integrity check, verifying the provider is configured, performing the provider self tests, and reporting status.
2. An embedded validated module (see certificate number 1291) provides cryptographic functions.

All operations of the module occur via calls from the Symantec applications and their respective internal daemons/processes. As such there are no untrusted services calling the services of the module, as APIs are not exposed.

2.1.1 Validation Level Detail

The following table lists the level of validation for each area in FIPS 140-2:

FIPS 140-2 Section Title	Validation Level
Cryptographic Module Specification	1
Cryptographic Module Ports and Interfaces	1
Roles, Services, and Authentication	1
Finite State Model	1
Physical Security	N/A
Operational Environment	1
Cryptographic Key Management	1
Electromagnetic Interference / Electromagnetic Compatibility	1
Self-Tests	1
Design Assurance	1
Mitigation of Other Attacks	1

Table 2 – Validation Level by DTR Section

2.1.2 Approved Cryptographic Algorithms

The module’s cryptographic algorithm implementations have received the following certificate numbers from the Cryptographic Algorithm Validation Program:

Algorithm	CAVP Certificate
AES ECB, CBC, CFB (128), OFB (128), CTR - [128, 192, 256 bit key sizes] CCM, GCM	1109
DSA	357
Dual EC DRBG (SP800-90)	15
ECDSA	130
FIPS 186-2 PRNG (Change Notice 1 – with and without the mod q step)	616
HMAC DRBG (SP800-90)	15
HMAC-SHA-1, HMAC-SHA-224, HMAC-SHA-256, HMAC-SHA-384, HMAC-SHA-512	621
RSA X9.31, PKCS#1 v1.5, PKCS#1 v2.1 (SHA256 – PSS)	522
SHA-1, SHA-224, SHA-256, SHA-384, SHA-512	1032
TDES – ECB, CBC, CFB-64, OFB-64 mode	806

Table 3 – FIPS-Approved Algorithm Certificates¹

2.1.3 Non-Approved Cryptographic Algorithms

The module does not implement any non-approved algorithms in FIPS mode; however, Diffie-Hellman and RSA key wrapping are allowed in FIPS mode of operation. The module utilizes the following non-FIPS-approved algorithm implementations:

- DES
- DESX
- Diffie-Hellman (Bit lengths for the Diffie-Hellman key agreement must be between 1024 and 2048 bits. Diffie Hellman shared secret provides between 80 bits and 112 bits of encryption strength.)
- EC Diffie-Hellman
- ECAES
- ECIES
- MD2
- MD5
- PBE
- Random Number Generators (ANSI X9.31, MD5Random, and SHA1Random)
- RC2 block cipher
- RC4 stream cipher
- RC5 block cipher
- PBE with SHA1 and Triple-DES
- RSA OAEP for key transport
- Raw RSA encryption and decryption
- RSA key wrapping (Bit lengths for an RSA key pair must be between 1024 and 4096 bits in multiples of 512. When used for transporting keys and using the minimum allowed modulus size, the minimum strength of encryption provided is 80 bits. Key wrapping methodology provides between 80 and 150 bits of encryption strength.)
- RSA Keypair Generation MultiPrime (two or three primes)
- RIPEMD160
- HMAC-MD5

¹ Note this implementation has received FIPS 140-2 Level 1 validation 1291:
<http://csrc.nist.gov/groups/STM/cmvp/documents/140-1/140val-all.htm#1291>

2.2 Module Interfaces

The figure below shows the module’s physical and logical block diagram:

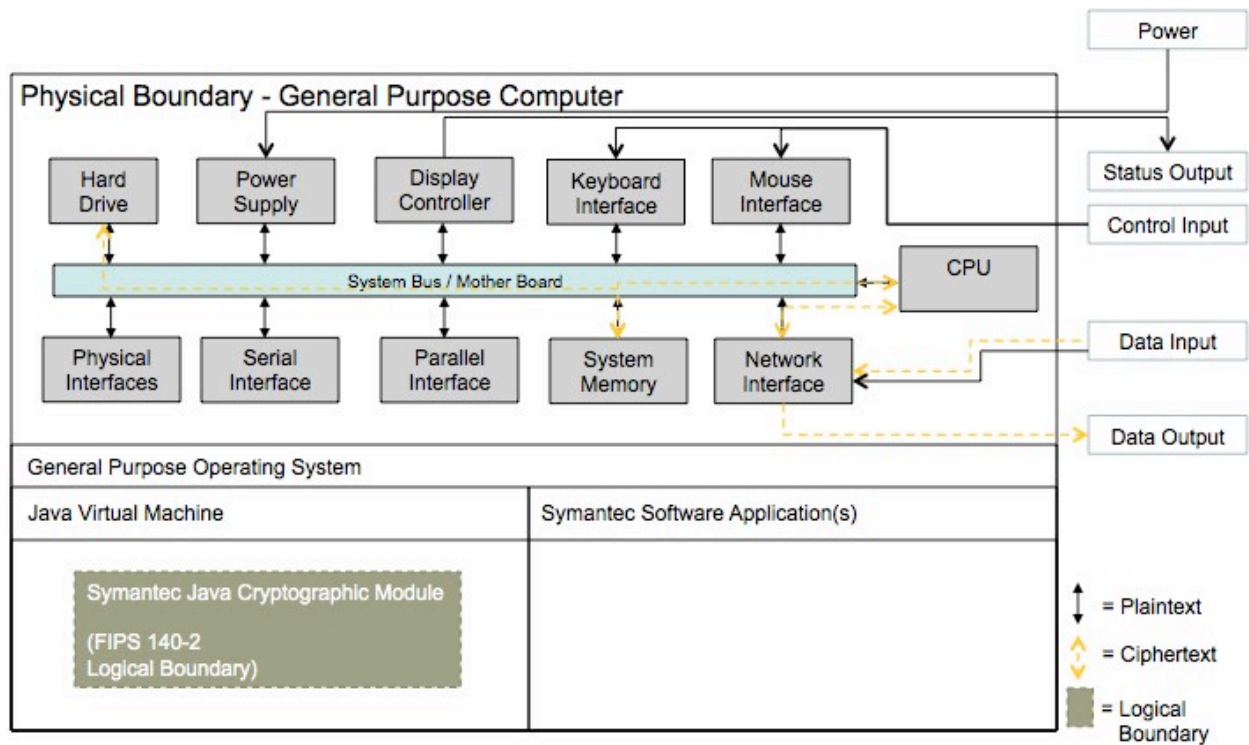

Figure 1 – Module Boundary and Interfaces Diagram

The interfaces (ports) for the physical boundary include the computer keyboard port, CDROM drive, floppy disk, mouse, network port, parallel port, USB ports, monitor port and power plug. When operational, the module does not transmit any information across these physical ports because it is a software cryptographic module. Therefore, the module’s interfaces are purely logical and are provided through the Application Programming Interface (API) that a calling daemon can operate. The logical interfaces expose services that applications directly call, and the API provides functions that may be called by a referencing application (see Section 2.3 – Roles, Services, and Authentication for the list of available functions). The module distinguishes between logical interfaces by logically separating the information according to the defined API.

The API provided by the module is mapped onto the FIPS 140- 2 logical interfaces: data input, data output, control input, and status output. Each of the FIPS 140- 2 logical interfaces relates to the module's callable interface, as follows:

FIPS 140-2 Interface	Logical Interface	Module Physical Interface
Data Input	Input parameters of API function calls	USB ports, network ports, serial ports, SCSI/SATA ports, DVD, audio Ports

FIPS 140-2 Interface	Logical Interface	Module Physical Interface
Data Output	Output parameters of API function calls	Display (e.g. VGA, HDMI, DVI, etc.), USB ports, network ports, serial ports, SCSI/SATA ports, audio ports, DVD
Control Input	API function calls	USB ports, network ports, serial ports, power switch
Status Output	For FIPS mode, function calls returning status information and return codes provided by API function calls.	Display, serial ports, network ports
Power	None	Power supply/connector

Table 4 – Logical Interface / Physical Interface Mapping

As shown in Figure 1 – Module Boundary and Interfaces Diagram and Table 5 – Module Services and Descriptions, the output data path is provided by the data interfaces and is logically disconnected from processes performing key generation or zeroization. No key information will be output through the data output interface when the module zeroizes keys. The module does not output key/CSP information while in an error state.

2.3 Roles, Services, and Authentication

The module supports a Crypto Officer and a User role. The module does not support a Maintenance role.

2.3.1 Operator Services and Descriptions

The services available to the User and Crypto Officer roles in the module are as follows:

Service	Roles	Input	Output	Key/CSP Access
On Demand Self-test	Crypto Officer	None	Status	None
Get FIPS140 Context	User	None	Status	None
Get seeder	User	None	Seed generator	None
Get Default Random Number Generator	User	None	Random Number Generator	None
Check FIPS 140-2 Compliance	User	None	Status	None
Get State	User	None	Status	None
Get Mode	User	None	Status	None
Set Mode	User	API call parameter	Status	None
Get Role	User	None	Status	None
Set Role	User	API call parameter	Status	None
Check Latest Self-Test Results	User	None	Status	None
Check Mode	User	None	Status	None
Configure CRNG	User	API call parameter	None	None
Disable library	User	API call parameter	None	None
Verify DSA Parameters	User	API call parameter	Status	None
Encryption	User	API call parameters, key, plaintext	Status, ciphertext	AES Key TDES Key
Decryption	User	API call parameters, key, ciphertext	Status, plaintext	AES Key TDES Key
Digital Signature Generation	User	API call parameters, key, message	Status, signature	RSA Private Key RSA Public Key DSA Private Key DSA Public Key
Digital Signature Verification	User	API call parameters, key, signature, message	Status	RSA Private Key RSA Public Key DSA Private Key DSA Public Key
Key Establishment Primitives	User	API call parameters, key	Status, key	RSA Private Key RSA Public Key DH Key ECDH Key

Service	Roles	Input	Output	Key/CSP Access
Key Generation	User	API call parameters	Status, key/key pair	AES Key TDES Key DSA Private Key DSA Public Key RSA Private Key RSA Public Key DH Key HMAC DRBG Key HMAC with SHA-1 and SHA-2 Keys

Random Number Generation	User	API call parameters	Status, random bits	FIPS 186-2 PRNG Seed FIPS 186-2 PRNG Seed Key EC DRBG Entropy EC DRBG S Value (Seed Length) EC DRBG init_seed HMAC DRBG Entropy HMAC DRBG V Value (Seed Length) HMAC DRBG Key HMAC DRBG init_seed
Zeroization	User	API call parameters	Status	All

Table 5 – Module Services and Descriptions

2.3.2 Operator Authentication

As required by FIPS 140-2, there are two roles (a Crypto Officer role and User role) in the module that operators may assume. As allowed by Level 1, the module does not support authentication to access services.

2.4 Physical Security

This section of requirements does not apply to this module. The module is a software-only module and does not implement any physical security mechanisms.

2.5 Operational Environment

The module operates on a general purpose computer (GPC) running on a modern version of Microsoft Windows as a general purpose operating system (GPOS). For FIPS purposes, the module is running on Microsoft Windows in single user mode and does not require any additional configuration to meet the FIPS requirements.

The module was tested on the following platforms:

- Microsoft Windows XP SP2 (32-bit) with Sun JRE 5.0
- Microsoft Windows XP SP2 (32-bit) with Sun JRE 6.0.

The GPC(s) used during testing met Federal Communications Commission (FCC) FCC Electromagnetic Interference (EMI) and Electromagnetic Compatibility (EMC) requirements for business use as defined by 47 Code of Federal Regulations, Part15, Subpart B. FIPS 140-2 validation compliance is maintained when the module is operated on other versions of the Microsoft Windows GPOS running in single user mode, assuming that the requirements outlined in NIST IG G.5 are met.

2.6 Cryptographic Key Management

The table below provides a complete list of Critical Security Parameters used within the module:

Keys and CSPs	Storage Locations	Storage Method	Input Method	Output Method	Zeroization	Access
AES Key	RAM	Plaintext	API call parameter	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
TDES Key	RAM	Plaintext	API call parameter	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
HMAC with SHA-1 and SHA-2 Keys	RAM	Plaintext	API call parameter	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
ECDH Key	RAM	Plaintext	Internally generated	API call parameter	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
DH Key	RAM	Plaintext	Internally generated	API call parameter	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
RSA Private Key	RAM	Plaintext	API call parameter	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
RSA Public Key	RAM	Plaintext	API call parameter	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
DSA Private Key	RAM	Plaintext	API call parameter	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
DSA Public Key	RAM	Plaintext	API call parameter	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
FIPS 186-2 PRNG Seed	RAM	Plaintext	Internally generated	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
FIPS 186-2 PRNG Seed Key	RAM	Plaintext	Internally generated	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
EC DRBG Entropy	RAM	Plaintext	Internally generated	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD
EC DRBG S Value (Seed Length)	RAM	Plaintext	Internally generated	None	<code>SensitiveData.clear()</code> power cycle	CO: RWD U: RWD

Keys and CSPs	Storage Locations	Storage Method	Input Method	Output Method	Zeroization	Access
EC DRBG init_seed	RAM	Plaintext	Internally generated	None	SensitiveData.clear() power cycle	CO: RWD U: RWD
HMAC DRBG Entropy	RAM	Plaintext	Internally generated	None	SensitiveData.clear() power cycle	CO: RWD U: RWD
HMAC DRBG V Value (Seed Length)	RAM	Plaintext	Internally generated	None	SensitiveData.clear() power cycle	CO: RWD U: RWD
HMAC DRBG Key	RAM	Plaintext	Internally generated	None	SensitiveData.clear() power cycle	CO: RWD U: RWD
HMAC DRBG init_seed	RAM	Plaintext	Internally generated	None	SensitiveData.clear() power cycle	CO: RWD U: RWD

R = Read W = Write D = Delete

Table 6 – Module Keys/CSPs

2.6.1 Key Generation

The module supports the generation of the DSA, RSA, and Diffie-Hellman (DH) and ECC public and Private Keys. The module uses a Federal Information processing Standard 186-2, Digital Signature Standard (FIPS 186-2) Approved random number generator and a FIPS Approved Dual Elliptic Curve Deterministic Random Bit Generator (ECDRBG SP 800-90) and HMAC DRBG for generating asymmetric and symmetric keys. Entropy for use in key generation is gathered by the embedded validated module; various system parameters are collected to suitably account for the strength of the generated key.

2.6.2 Key Entry, Output, and Protection

All keys and CSPs reside on memory internally allocated by the module and can only be output using the exposed APIs. The module does not support key entry or output from the physical boundary. The operating system and the JRE protect the memory and process space from unauthorized access.

2.6.3 Key/CSP Storage and Zeroization

The module does not provide long-term cryptographic key storage. Storage of keys is the responsibility of the user of the module. All keys and CSPs are automatically zeroized by the module at the end of their lifetime. The user can ensure destruction of sensitive data by calling `SensitiveData.clear()`. Powercycling the module will also zeroize keys.

2.7 Self-Tests

The module performs power-up and conditional self-tests to ensure proper operation. If a power-up self-test fails, the module is disabled and throws a `SecurityException`. The module can only leave the disabled state by restarting the Java Virtual Machine. If a conditional self-test fails, the module throws a `SecurityException` and aborts the operation. A conditional self-test failure does not disable the module.

In event of a self-test failure, the module provides the following message: `Could not initialize class com.rsa.jsafe.provider.JsafeJCE.`

The following sections discuss the module's self-tests in more detail.

2.7.1 Power-On Self-Tests

The module implements the following power-on self-tests:

TYPE	DETAIL
Software Integrity Check	RSA Digital Signature Verification
Known Answer Tests	<ul style="list-style-type: none"> • AES • DES • ECDRBG • ECDSA • FIPS186 PRNG • HMAC DRBG • HMAC SHA-1 • HMAC SHA-224 • HMAC SHA-256 • HMAC SHA-384 • HMAC SHA-512 • RSA (signature) KAT • SHA-1 • SHA-224 • SHA-256 • SHA-384 • SHA-512 • TDES
Pair-wise Consistency Tests	<ul style="list-style-type: none"> • DSA • ECDSA • RSA

Table 7 – Power-On Self-Tests

Power-on self-tests are executed automatically when the module is loaded into memory.

2.7.2 Conditional Self-Tests

The module implements the following conditional self-tests:

TYPE	DETAIL
Pair-wise Consistency Tests	<ul style="list-style-type: none"> • DSA • ECDSA • RSA
Continuous RNG Tests	Performed on all approved and non-approved RNGs

Table 8 – Conditional Self-Tests

2.7.3 Critical Functions Tests

The module implements the following critical functions tests:

TYPE	DETAIL
Known Answer Tests	<ul style="list-style-type: none"> • ECAES and ECIES when operating in FIPS140_ECC_MODE • MD5 and HMAC-MD5 when operating in FIPS140_SSL_MODE • MD5, HMAC-MD5, ECAES, and ECIES when operating in FIPS140_SSL_ECC_MODE

Table 9 – Critical Functions Tests

2.8 Mitigation of Other Attacks

As a defense against timing attacks, RSA key operations implement blinding by default. By using the blinding method, it is ensured that the decryption time is not correlated to the input ciphertext; as a consequence, attempts of timing attacks are thwarted. Blinding is implemented through blinding modes with the following available options:

- Blinding mode off
- Blinding mode with no update (the blinding value is squared for each operation)
- Blinding mode with full update (a new blinding value is used for each operation).

3 Guidance and Secure Operation

This section describes how to configure the module for FIPS-approved mode of operation. Operating the module without maintaining the following settings will remove the module from the FIPS-approved mode of operation.

3.1 Initial Setup

The Symantec cryptographic module wrapper fully initializes and manages FIPS mode. This includes performing an integrity check, verifying the provider is configured, performing the provider self tests, and reporting status.

When the module is loaded by the host application, the `FIPSMoDeManager.startFIPSMoDe()` function is called to initialize the module in a FIPS-approved mode of operation. This function checks the integrity of the module, runs all power-up self-tests, and, if successful, sets the module in the `FIPS140_SSL_MODE` by default. The initialization function records the following message to a log file:

```
System running in FIPS 140 mode.
```

The module uses JAR-signing to check the integrity of the module (the consuming application provides the signing certificate for the JARs of the module). Upon failure of either the software integrity test or any of the self-tests, the function throws an exception as status output and disables the library. Additionally, the module logs the following message:

```
FIPS initialization failed, FIPS cryptographic services disabled
```

3.2 Crypto Officer Guidance

3.2.1 Software Packaging and OS Requirements

The module must be installed on a General Purpose Operating System running in single user mode. To configure single-user mode, the following must be disabled:

- Remote registry and remote desktop services
- Remote assistance
- Guest accounts
- Server and terminal services

Contact Microsoft support for configuration details; specific configuration steps are beyond the scope of this document.

3.2.2 Enabling FIPS Mode

No specific configuration is required to enforce FIPS mode beyond the `FIPSMoDeManager.startFIPSMoDe()` function. Status can be verified by calling the `FIPSMoDeManager.isInFIPS140MoDe()` function, which returns true if the module is in a FIPS-Approved mode and false if in a non-Approved mode.

3.2.3 Management Procedures

The Crypto Officer can run the self-tests at any time by calling the `runSelfTests()` function.

3.2.4 Additional Rules of Operation

1. All host system components that can contain sensitive cryptographic data (main memory, system bus, disk storage) must be located in a secure environment.
2. The writable memory areas of the Module (data and stack segments) are accessible only by the calling application so that the Module is in "single user" mode, i.e. only the calling application has access to that instance of the Module.
3. Imported keys should be generated via FIPS-approved manner.
4. The operating system is responsible for multitasking operations so that other processes cannot access the address space of the process containing the Module.
5. The operator must invoke the `SensitiveData.clear()` method before changing the module mode in order to ensure all keys and CSPs are zeroized.

3.3 User Guidance

3.3.1 General Guidance

In order to use the module in FIPS 140 mode of operation, the User must only use the approved algorithms as listed in Table 3 – FIPS-Approved Algorithm Certificates. The requirements for using the approved algorithms in a FIPS 140 mode of operation are as follows:

- The bit-length for a DSA key pair must be 1024 bits.
- Random Number Generators must be seeded with values of at least 160 bits in length.
- HMAC-DRBG random data requests must be less than 219 bits in length.
- Bit lengths for an RSA key pair must be between 1024 and 4096 bits in multiples of 512. When used for transporting keys and using the minimum allowed modulus size, the minimum strength of encryption provided is 80 bits.

- Bit lengths for an HMAC key must be one half of the block size.
- If RSA key generation is requested in FIPS140 mode, the module always uses the FIPS140-approved RSA X9.31 key generation procedure.
- Key wrapping methodology provides between 80 and 150 bits of encryption strength.
- EC key pairs must have domain parameters from the set of NIST-recommended named curves (P192, P224, P256, P384, P521, B163, B233, B283, B409, B571, K163, K233, K283, K409, and K571). The domain parameters can be specified by name or can be explicitly defined. The module limits possible curves for Dual EC DRBG to P-256, P-384, and P-521 in accordance with SP 800-90.
- The module implements both Diffie-Hellman and EC Diffie-Hellman key agreement schemes.
- EC Diffie-Hellman primitives must use curve domain parameters from the set of NIST-recommended named curves listed above. The domain parameters can be specified by name, or can be explicitly defined. When using the NIST-recommended curves, the computed Diffie-Hellman shared secret provides between 80 bits and 256 bits of encryption strength.
- When using an Approved RNG to generate keys, the RNG's requested security strength must be at least as great as the security strength of the key being generated.

Additionally, operators should take care to zeroize CSPs when they are no longer needed.

3.4 Role Changes

If the operator needs to operate the module in different roles, then the operator must ensure that all instantiated cryptographic objects are destroyed before changing from the Crypto User role to the Crypto Officer role, or unexpected results could occur.

3.5 Embedded Module Modes of Operation

The module supports five modes of operation:

- FIPS140_MODE
- FIPS140_SSL_MODE
- NON_FIPS140_MODE
- FIPS140_ECC_MODE
- FIPS_SSL_ECC_MODE

The following table lists the values that can be used in the `setMode()` method to change the mode of operation, and the algorithms available in that mode.

Value in <code>setMode()</code>	Available Algorithms
FIPS140_MODE FIPS 140-2 approved	Provides all cryptographic algorithms listed in Table 3 – FIPS-Approved Algorithm Certificates. The default random number generator is the FIPS 186-2 PRNG.
FIPS140_SSL_MODE FIPS 140-2 approved if used with TLS protocol implementations This is the default mode for the Symantec Java Cryptographic Module Version 1.1.	Provides all cryptographic algorithms listed in Table 3 – FIPS-Approved Algorithm Certificates plus MD5. This mode can be used in the context of the key establishment phase in the TLSv1, TLSv1.1 and TLSv1.2 protocols. For more information, see section 7.1 Acceptable Key Establishment Protocols in <i>Implementation Guidance for FIPS PUB 140-2 and the Cryptographic Module Validation Program</i> . The implementation guidance disallows the use of the SSLv2 and SSLv3 versions. Cipher suites that include non-FIPS 140-2-approved algorithms are unavailable. This mode allows implementations of the TLS protocol to operate the module in a FIPS 140-2-compliant manner with the FIPS 186-2 PRNG as the default.
FIPS140_ECC_MODE Not FIPS 140-2 approved	Provides all available algorithms listed in Section 2.1.2 and Section 2.1.3.
FIPS140_SSL_ECC_MODE Not FIPS 140-2 approved	Provides the same algorithms as FIPS140_MODE, plus ECAES and ECIES. The random number generator in this mode is the Dual ECDRBG.
NON_FIPS140_MODE Not FIPS 140-2 approved	Provides the same algorithms as FIPS140_SSL_MODE, plus ECAES and ECIES. The random number generator in this mode is the Dual ECDRBG. The same restrictions with respect to protocol versions and cipher suites as in FIPS140_SSL_MODE apply.

Table 10 – Values in `setMode` to Change the Mode of Operation

Once the module is operating in a FIPS-Approved mode, the `setMode()` function can only be used to change to a non-FIPS Approved mode. In order to return to a FIPS-Approved mode, the library must be halted and then reloaded (by either calling the relevant services or power cycling). When changing to an approved mode of operation, the toolkit causes the power-up self-tests to run.

3.6 Embedded Module Random Number Generator

In FIPS 140-2 modes, the module provides a default RNG. For the FIPS140_MODE and FIPS140_SSL_MODE, the module provides a FIPS 186-2 Pseudo Random Number Generator (PRNG) and uses this PRNG internally by default in all operations that require the generation of random

numbers. For FIPS140_ECC_MODE and FIPS140_SSL_ECC_MODE, the module implements an ECDRBG internally by default.

Operators in all modes (Approved or non-Approved) can select either the FIPS 186-2, ECDRBG or HMAC DRBG when creating a RNG object and setting this object against the operation requiring random number generation (for example key generation). However, whenever DSA is used, the RNG used internally will always be the FIPS 186-2 Change Notice 1 Option 1 with mod Q PRNG.
